

E&ICT Academy, IIT Kanpur

A Joint Initiative of MeitY & IIT Kanpur

# **Advanced Certification in AI & Machine Learning**

The Advanced Certification in AI & Machine Learning course by the E&ICT Academy of IIT Kanpur in association with Edvancer is one of the most comprehensive and state of the art programs in this domain. This 500 learning hours program for working professionals & freshers is designed, curated and delivered by faculty from IIT's and Industry. This program is a blend of academic rigour and significant industry exposure equipping you with highly advanced conceptual knowledge and futuristic skillsets unmatched by any other such programs. This program once completed satisfactorily strives to prepare you for seamless accelerated transition to a high-end career in data science & AI. On successful completion of the program you will receive a certificate from E&ICT Academy, IIT Kanpur, a joint initiative of IIT Kanpur and Ministry of Electronics & Information Technology, Government of India.

# **Full Curriculum**

# **Module 1: Machine Learning in Python**

What is this module about?: Through this Machine Learning module, you will learn how to process, clean, visualize and automate decision making through data science by using Python, one of the most popular machine learning tools. You will learn cutting edge machine learning techniques in Python.

**Tools to be learnt:** Python (Libraries like Pandas, Numpy, Scipy, Scikit-learn, Seaborn, Beautifulsoup)

Class Duration: 78 hours (13 weekends)

| Topic   | What does it mean?   |
|---|--|
| Introduction to Machine Learning in Python  • What is machine learning & why is it so important?  • Applications of machine learning across industries  • Machine Learning methodology  • Machine Learning Toolbox  • Tool of choice- Python: what & why?  • How to approach a machine learning problem using a case study  • Course Components | In this section we shall provide you an overview into the world of machine learning (ML). You will learn about the various applications of machine learning, how companies from all sort of domains are solving their day to day to long term business problems. We'll learn about required skill sets of a machine learning expert which make them capable of filling up this vital role. Once the stage is set and we understand where we are heading we discuss why Python is the tool of choice in ML. |

#### **Python Training**

## **Introduction to Python**

- Installation of Python framework and packages: Anaconda and pip
- Writing/Running python programs using Spyder, Command Prompt
- Working with Jupyter Notebooks
- Creating Python variables: Numeric, string and logical operations
- Basic Data containers: Lists, Dictionaries, Tuples & sets
- Importing & exporting data
- Practice assignment

Python is one of the most popular & powerful languages for data science used by most top companies like Facebook, Amazon, Google, Yahoo etc. It is free and open source. This module is all about learning how to start working with Python. We shall teach you how to use the Python language to work with data.

#### This is where we move beyond simple data Flow Control, Iterative Operations & Functions in Python containers and learn about amazing possibilities Writing for loops in Python and functionalities hidden in various associated • List & Dictionary Comprehension operators. We get introduced to wonderful world • While loops and conditional blocks of loops, list and dictionary comprehensions. In • List/Dictionary comprehensions with loops addition to already existing functions and classes Writing your own functions in Python we learn to write our own custom functions and • Writing your own classes and functions as class objects classes. This module sets the stage for handling • Practice assignment data and ML algorithm implementation in python. **Basic Statistics & Maths** • Introducing statistical inference • Estimators and confidence intervals You will get a refresher here on the college level statistics & maths required for machine learning & Central tendency measures Variability measures Statistical distributions Matrices & Linear Equations Data Summary, Numerical and Visual EDA in Python Need & ways for data summary • Introduction to pandas Data summary is extremely important to • Summarising numeric data in Pandas understand what the data is saying and gain Summarising categorical data insights in just one glance. Visualization of data is a Group wise summary of mixed data strong point of the Python software using the latest Need for visual summary Seaborn package. • Introduction to Seaborn • Visual summary of different data combinations • Practice Exercise Data Handling in Python using NumPy & Pandas • Introduction to NumPy arrays, functions &properties • Dataframe functions and properties • Creating, Modifying, Renaming dataframe columns as Python is a very versatile language and in this Pandas series module we expand on its capabilities related to • Sub-setting data on conditions, row and column indices, data handling. Focusing on packages Numpy and data types Pandas we learn how to manipulate data & • Creating flag features for categorical columns undertake feature engineering which will be eventually useful in converting raw data suitable • Imputing missing values, modifying column values with for machine learning algorithms. dictionary replacements • Reading and writing external data Creating summary features • Handling datetime data • Manipulating data columns **Hypothesis Testing**

- What is a hypothesis?
- Statistical distribution & confidence intervals
- Central Limit Theorem
- Single & Two sample T-Tests
- ANOVA
- Chi-Square test
- Non-parametric tests

With 95% confidence we can say that there is an 55% chance, people visiting this site twice will enroll for the course ©. Here, you learn how to create a hypothesis like this, test and validate it through data within a statistical framework and present it with clear and formal numbers to support decision making.

## **Machine Learning Models in Python**

#### **Basics of Machine Learning 1**

- Converting Business Problems to Data Problems
- Broad Categories of Business Problems
- Supervised and Unsupervised Machine Learning Algorithm
- Drivers of ML algorithms
- Cost Functions

In this module we understand how we can transform our business problems to data problems so that we can use machine learning algorithms to solve them. We will further get into discovering what all categories of business problems and subsequently which machine learning algorithms are there.

# **Basics of Machine Learning 2** • Brief introduction to Gradient Descent • Importance of Model Validation • Methods of Model Validation

- Introduction to Cross Validation and Average Error
- Parameter Estimation for a simple linear model with gradient descent
- Model evaluation metrics for regression problems
- Model evaluation metrics for classification problems

## **Generalised Linear Models in Python**

- Linear Regression
- Limitation of simple linear models and need of regularisation
- Ridge and Lasso Regression (L1 & L2 Penalties)
- Getting Started with sklearn API
- Introduction to Classification with Logistic Regression
- Methods of threshold determination and performance measures for classification score models
- Case Studies

We start with implementing machine learning algorithms in this module. We also get exposed to some important concepts related to regression and classification which we will be using in the later modules as well. Also this is where we get introduced to scikit-learn, the legendary python library famous for its machine learning prowess.

We'll learn what is the ultimate goal of any

description of the mother of many modern

and methods of validation of our results.

optimisation methods- Gradient Descent. We'll

machine learning algorithm and go through a brief

wrap up this module with discussion on importance

#### **Decision Tree Models using Python**

- Introduction to decision trees
- Tuning tree size with cross validation
- Introduction to bagging algorithm
- Random Forests
- Grid search and randomized grid search
- ExtraTrees (Extremely Randomised Trees)
- Partial Dependence Plots
- Case Studies
- Assignments

In this module we will learn a very popular class of machine learning models, rule based tree structures also known as Decision Trees. We'll examine their biased nature and learn how to use bagging methodologies to arrive at a new technique known as Random Forest to analyse data. We'll further extend the idea of randomness to decrease bias in ExtraTrees algorithm. In addition, we learn about powerful tools used with all kind of machine learning algorithms, gridSearchCV and RandomizedSearchCV.

# **Boosting Algorithms using Python**

- Concept of weak learners
- Introduction to boosting algorithms
- Gradient descent in functional space
- Gradient Boosting Machines (GBM) for regression and classification
- Extreme Gradient Boosting (XGBoost)
- Case study
- Home exercise

Want to win a data science contest on Kaggle or data hackathons or be known as a top data scientist? Then learning boosting algorithms is a must as they provide a very powerful way of analysing data and solving hard to crack problems.

#### Support Vector Machines (SVM) and KNN in Python

- Introduction to idea of observation based learning
- Distances and Similarities
- K Nearest Neighbours (KNN) for classification
- Introduction to SVM for classification
- Regression and classification with SVM
- Case study
- Home exercises

We step in a powerful world of "observation based algorithms" which can capture patterns in the data which otherwise go undetected. We start this discussion with KNN which is fairly simple. After that we move to SVM which is very powerful at capturing non-linear patterns in the data.

#### **Unsupervised learning in Python**

- Need for dimensionality reduction
- Introduction to Principal Component Analysis (PCA)
- Difference between PCAs and Latent Factors
- Patterns in the data in absence of a target
- Segmentation with Hierarchical Clustering and K-means
- Measure of goodness of clusters
- Limitations of K-means
- Introduction to density based clustering (DBSCAN)

Many machine learning algorithms become difficult to work with when dealing with many variables in the data. In comes to rescue PCA which solves problems arising from data which has highly correlated variables. The same idea can be extended to find out hidden factors in our data with Factor Analysis which is used extensively in surveys and marketing analytics.

We also learn about two very important

segmentation algorithms; K-means and DBSCAN Anomaly detection with DBSCAN and one-SVM and understand their differences and strengths. • Case Studies Practice Assignments **Neural Networks** • Introduction to Neural Networks Artificial Neural Networks are the building blocks of • Single layer neural network artificial intelligence. Learn the techniques which • Multiple layer Neural network replicate how the human brain works and create Activation functions machines which can solve problems like humans. • Back propagation Algorithm • Multi-layer perceptrons in sklearn Practice assignment Unstructured text data accounts for more and more **Text Mining in Python** interaction records as most of our daily life moves • Quick Recap of string data functions online. In this module we start our discussion by • Gathering text data using web scraping with urllib looking at ways to collect all that data. In addition Processing raw web data with BeautifulSoup to scraping simple web data; we'll also learn to use data APIs with example of Twitter API, right from • Collecting twitter data with Twitter API the point of creating a developer account on • Introduction to Naive Bayes twitter. Further we discuss one of the very • Feature Engineering for text Data powerful algorithm when it comes to text data; • Feature creation with TFIDF for text data Naive Bayes. Then we see how we can mine the Case Studies text data. **Machine Learning Beyond Traditional Model Building Ensemble Methods for mixed algorithms** Individual machine learning models extract pattern from the data in different ways, which at times • Combining multiple models with simple and weighted results in them extracting different patterns from the data. Rather than sticking to just one algorithm • Simple Majority vote and weighted majority vote and not making use of other's results is what we • Introduction to Blending move past in this module. We learn to make use of Introduction to Stacking multiple ML models taken together to make our • Stacking gotchas and 2 layer model in Python predictive modelling solutions even more powerful. • Case Study Python pipelines and model in production For making quick prototypes of your solutions • Discussion on elements of model deployment which can be scaled later as interactive • Introduction to sklearn pipelines for consistent data visualisation in the form of standalone or hosted processing web pages, we introduce you to Bokeh, an evolving • Introduction to joblib for model saving and loading library in python which has all the tools that you'll • Basic flask API app for understanding model deployment need to do the same. **Version Control using Git** We finish this module with a discussion on two very • Need and Importance of Version Control important aspects of a data scientist's work. First is • Setting up git and Github accounts on local machine version control which enables you to work on large • Creating and uploading GitHub Repos projects with multiple team members scattered across the globe. We learn about git and most • Git commands widely used public platform version control that is • Push and pull requests with GitHub repos GitHub. Merging and forking projects Advanced Ideas on Feature Engineering, Model Interpretation, Parameter Tuning, Genetic Algorithm Representing cyclic date time features • Revisiting dummies creation for categorical data Learn the tips and tricks used by highly experienced machine learning engineers to create more relevant Categorical embeddings data features, interpret models in a better manner, • Permutation feature importance with rfpimp and feature simplify complex models and find optimal values. This module is designed to give you skills equivalent • Experiments on capabilities of algorithms for extracting to a very experienced data scientist. non-linear relationships [polynomial vs log vs inverse vs ratio etc.] • Global model interpretation with partial dependence plots with package skater

- Surrogate Trees as methods for simplifying a complex model
- Local interpretation [Observation level] with LIME
- Finding optimal values of features for min/max target given an ML model [using genetic algorithm]

## Module 2: Deep Learning (Artificial Intelligence) Using Tensorflow and Keras

What is this module about?: Through this module, you will learn the various techniques used in the world of artificial intelligence like deep learning techniques, reinforcement learning, NLP and computer vision using latest Python libraries Tensorflow and Keras. This module will put you on the cutting edge of technology and make you future proof.

**Tools to be learnt:** Tensorflow and Keras

Class Duration: 66 hours (11 weekends)

| Торіс   | What does it mean?  |
|---|---|
| <ul> <li>Introduction to Al and Deep Learning</li> <li>What is Al?</li> <li>How will Al change the world?</li> <li>What is Deep Learning?</li> <li>Uses of Deep Learning?</li> <li>Examples of Deep Learning &amp; Al</li> </ul>  | Get introduced to the world of Artificial Intelligence which is poised to change the entire world/ Understand what is deep learning and how it is used in Al  |
| <ul> <li>Introduction to parameter optimisation</li> <li>Neural Network representation</li> <li>Gradient descent with backpropagation for a generic feedforward network</li> <li>Optimisers in deep learning [SGD, SGD with momentum, RMSProp, Adam]</li> <li>Understanding difference in optimisers with implementation in python from scratch</li> </ul>  | Learn the basics of deep learning and how to change the attributes of your neural network such as weights and learning rate to reduce the losses.  Optimization is the most essential ingredient in the recipe of deep learning algorithms.   |
| Getting Started with Tensorflow  What is a tensor?  Setting up Tensorflow and the GPU instance  Understanding computation graph and basics of Tensorflow  Implementing simple perceptron in Tensorflow  Simple linear Regression with Gradient Tape  Working with Google Collab  Visualising training with tensor board  Classification with a deep feedforward network using base Tensorflow and Gradient tape | TensorFlow™ is an open source software library in Python for high performance numerical computation. Originally developed by researchers and engineers from the Google Brain team within Google's AI organization, it comes with strong support for machine learning and deep learning. |

### **Deep Learning Algorithms**

# **Deep Feed Forward & Convolutional Neural Networks**

- Limitations of simple feed forward networks
- How vision works for humans
- Understanding convolutions, strides, padding, filters etc.
- Convolutions for extracting features from images
- How receptive fields change in sequence of convolution networks
- Pooling for parameter reductions [ max , average , sum]
- Implementing CNN with Tensorflow
- Regularizing with dropout

A feedforward neural network is an artificial neural network wherein connections between the nodes do not form a cycle and information only flows in one direction. A convolutional neural network (CNN, or ConvNet) is a class of deep, feed-forward artificial neural networks, most commonly applied to analysing visual imagery. Learn these techniques for classifying images.

# Module 3: Data Analysis in SQL (Videos only)

What is this module about?: This Data Analyst using SQL video tutorial teaches you how to use the popular SQL language to analyse data stored in databases. SQL is a requirement in almost all analytics roles & this module will make you eligible to work as a data analyst. In this SQL tutorial you will learn how to communicate with databases, extract data from them, manipulate the data, analyse it and create reports.

Tools to be learnt: MS SQL

Class Duration: 6 hours of pre-recorded videos

| Торіс  | What does it mean?   |
|--|--|
| <ul> <li>Introduction To SQL</li> <li>What is SQL?</li> <li>Why SQL?</li> <li>What are relational databases?</li> <li>SQL command group</li> <li>MS SQL Server installation</li> </ul> | Structured Query Language (SQL) is a standard language for storing, manipulating and retrieving data in databases. It is a heavily used language and a must know for every data scientist. Here we will introduce you to SQL using MS SQL. |

| SQL Data Types & Operators                            |  |
|---|--|
| • SQL Data Types                                      |  |
| • Filtering Data                                      | Learn about various types of data and how to filter  |
| Arithmetic Operators                                  | and conduct basic operations on data in databases  |
| <ul> <li>Comparison operators</li> </ul>              | using SQL.   |
| Logical Operators                                     |  |
| • Exercises   |  |
| Useful Operations in SQL                              |  |
| Distinct Operation                                    |  |
| <ul><li>Top N Operation</li></ul>                     |  |
| <ul> <li>Sorting results</li> </ul>                   | Learn more advanced operations on data.  |
| <ul> <li>Combine results using Union</li> </ul>       | Learn more advanced operations on data.  |
| Null comparison                                       |  |
| • Alias   |  |
| • Exercises   |  |
| Aggregating Data in SQL                               |  |
| Aggregate functions                                   | A conserve data value variante conditione and  |
| Group By clause                                       | Aggregate data using various conditions and clauses in SQL to gain the answers you are looking   |
| Having clause   | for.   |
| Over clause   |  |
| • Exercises   |  |
| Writing Sub-Queries in SQL                            |  |
| <ul><li>What are sub-queries?</li></ul>               | A subquery is a SQL query within a query. Subqueries are nested queries that provide data to   |
| Sub-query rules                                       | the enclosing query. In this module you will learn   |
| <ul> <li>Writing sub-queries</li> </ul>               | how to write various sub-queries.  |
| • Exercises   |  |
| Common function in SQL                                |  |
| Ranking functions                                     |  |
| Date & time functions                                 | Learn some of the common functions available in  |
| Logical functions                                     | SQL to transform the data into more meaningful   |
| String functions                                      | data.  |
| • Conversion functions                                |  |
| Mathematical functions                                |  |
| • Exercises   |  |
| Analytic Functions in SQL                             |  |
| <ul><li>What are analytic functions?</li></ul>        | Here you will learn various analytics function in SQL  |
| <ul> <li>Various analytic functions</li> </ul>        | to undertake data analysis in SQL.   |
| <ul> <li>SQL syntax for analytic functions</li> </ul> |  |
| • Exercises   |  |
| Writing DML Statements                                |  |
| <ul><li>What are DML Statements?</li></ul>            | DML is approviation of Data Manipulation Language  |
| • Insert statement                                    | DML is abbreviation of Data Manipulation Language in SQL. It is used to retrieve, store, modify, delete,   |
| Update statement                                      | insert and update data in databases.   |
| Delete statement                                      | ,  |
| • Exercises   |  |
| Writing DDL Statements                                |  |
| What are DDL Statements?                              | DDL refers to "Data Definition Language", a subset   |
| Create statement                                      | of SQL statements that change the structure of the   |
| Alter statement                                       | database schema in some way, typically by creating, deleting, or modifying schema objects  |
| Drop statement  | such as databases, tables, and views.  |
| • Exercises   | ,  |
| Using Constraints in SQL                              | Constraints provide a standard mechanism to  |
| What are constraints?                                 | maintain the accuracy and integrity of the data inside table. There are several different types of constraints in SQL which you will learn here. |
| Not Null Constraint                                   |  |
|   |  |

| <ul> <li>Primary key constraint</li> <li>Foreign key constraint</li> <li>Check constraint</li> <li>Default Constraint</li> </ul>   |   |
|--|---|
| <ul> <li>Exercises</li> <li>SQL Joins</li> <li>What are joins?</li> <li>Cartesian Join</li> <li>Inner Join</li> <li>Left &amp; Right Join</li> <li>Full Join</li> <li>Self Join</li> </ul> | A SQL Join statement is used to combine data or rows from two or more tables. Learn the various joins in SQL in this module.  |
| Views in SQL  • What are views?  • Create View  • Drop view  • Update view   | A view is a virtual table that consists of columns from one or more tables. Though it is similar to a table, it is not stored in the database. It is a query stored as an object. Hence, a view is an object that derives its data from one or more tables. Learn how to create these views in this module. |
